

Deep Root Feeding

 **Even after trees and shrubs have dropped their leaves and seemingly stopped growing, roots continue to grow.**

Soil temperatures are still warm enough for root growth through mid-winter.

What In Harmony can do

Deep root feeding is part of In Harmony's natural plant care program. In the winter we may deep root feed your landscape plants with a mixture of nutrients and a bio-stimulant to promote root growth and improve plant nutrition.

We inject a liquid formula into the soil surrounding plants to deliver nutrients directly to plant root systems. This encourages root cell division and repair. Any remaining nutrients will be available for renewed shoot growth in the spring.

Most of the nutrients in fertilizers applied at the surface take a long time to reach the roots of plants. The benefit of deep root feeding is that all the nutrients can immediately be used by the tree or shrub being fed.

Deep root feeding encourages stronger root systems and improves nutrient levels.

This produces tougher, more vigorous plants to better resist insect pests and diseases. Deep root feeding with organic products

is another way In Harmony helps keep your plants healthy, happy and beautiful.
